

Functions in python

- why do we need function lets understand one scenario you might be working on simple or complex project
- when you work on complex project break down complex project to smaller task.
- when you talk about smaller task of course you need to writing multiple statement.
- e.g if you want to operate payment operation in that you need to multiple statement all that statement keep it together & re useable later.
- all the statement of the tasks are stays together thats why we are creation function

```
In [ ]: # FUNCTION -->
- Inbuild function -- print(), type(), id(), sqrt(), max(), min(), sqrt(), ceil(), etc
- User defined function
- function is collection of statement
- 2 main property of the function is -- define the function & calling the function
- function always define with def & function always declares as ()
difference between variable & function || a - variable || b() - function
```

```
In [1]: def greet(): # define the function hear
        print('good evening') # print the statement
```

```
In [2]: def greet():
        print('good evening')
        greet()
```

good evening

```

```
nit
20
21
```

Default argument

- while you open meta accountk minimum age criterial is so by default age is 18

```
In [71]: def person(name,age): # in this code we expected to print 2 but we got by default
          print(name)
          print(age)
```

```
person('nit')
```

```
